Larger Sized Units For Pond, Pool, And Water Management Available

All Units Are Weather Resistant And Come With A Limited Lifetime Warranty On The Housing. International Units And Parts Are Available. Units Can Also Be Used As Clarifiers

How Ultraviolet Works

UV is a proven dependable method for controlling algae, bacteria, and protozoa. The ultraviolet lamp emits a germicidal ray which alters or disrupts the DNA or RNA of single celled organisms. By properly implementing an Aqua Ultraviolet system in-line these organisms can be eradicated effectively without any harmful residuals. The beneficial growth on the bottom and sides of the pond is not disrupted only free floating organisms that pass through the UV are eradicated.

Always the leader in technology, **AQUA ULTRAVIOLET®** sets the industry standard again with its optional wiper cleaning system. Keep your quartz sleeve crystal clear and 100% efficient without opening the unit or removing any parts in the process. When it comes to innovation and quality, look to the leader... **AQUA ULTRAVIOLET®**.

Unit comes in black or white
